How to implement different types of edge computing for Smart factory application

More extensive uses of edge computing will use servers that are much closer to the industrial plant, some in shared facilities with others owned or rented directly by the plant operator to host vital, high-performance applications. Industrial units utilize edge-computing hardware which will filter the data produced by local machines and update the most important aspects to a remote data Centre or cloud infrastructure. In Smart edge technologies, IloT devices, sensors, actuators and controllers are used to track the health of equipment and the moving parts within it. With edge computing, the machine does not need to communicate with the central cloud before making a decision that will preserve the equipment and reduce downtime in real-time.

Distributed computing infrastructure and Data processing are two major components of edge computing. Depending upon the complexity of the analytics needed, the computing infrastructure might range from a simple MCU to a high-end GPU. Edge computing comprises of compute, storage, data management, data analysis and networking amongst others. The information is transferred to the cloud for further analysis or integration into a bigger system depending upon the complexity.

Many of the sensors used on the shopfloor are wireless, communicating via Bluetooth, Wifi, Zigbee, or Thread protocols. These sensors may not use typical fieldbus-over-TCP/IP protocols, instead of relying on IoT-specific standards like CoAP and MQTT. Intelligent industrial gateways often have a CPU capable of running a sophisticated operating system like Linux or Windows 10, as well as software tools like Node-

RED and general-purpose programming languages like C, C++, and Python.

As cited in the whitepaper titled 'Edge computing in the industrial environment' in the section 'The forms of edge computing', the edge devices are formed into thick, thin and micro edge sublayers. The thick edge, or the thick-compute layer, includes the on-premises data centres and shared facilities operated by internet or cellular service providers and others who will provide on-demand access for computing and storage resources. It covers the traditional way which has been used to run SCADA and similar applications. The thin edge and the micro edge represent the layer that is closest to the shop floor machinery and the part of the industrial computing ecosystem that is the most mature. The thin edge includes devices such as PLCs and specialized embedded computers that are built into machine tools and other production equipment. The micro edge represents the sensors that acquire data from process and manufacturing equipment that, traditionally, have been directly attached to PLCs.

Industrial Edge and Enterprise Edge are the two technologies to be considered. In Industrial Edge, large numbers of sensors are connected with different protocols, different data sources, and incompatible data formats, bridging industrial equipment and factory systems to meet the digital world. When coming to Enterprise Edge, it computes resources and manages Industrial Edge and deploys enterprise-level infrastructure on the factory floor.

Use case: Smart Factory Solution

As shown in the below figure, a Smart Factory Solution has the capability to connect multiple sensors to monitor the status, automate & collect data, analyse it and derive useful insights to improve manufacturing operations. Industrial edge computing can be set up in such a way that an enterprise reaps the benefits of both edge computing and the scalable resources of cloud computing.

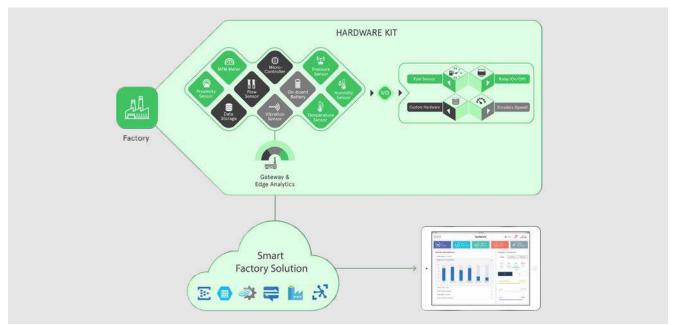

Figure: Smart Factory Solution

As depicted in the preceding figure, it involves Site assessment whereby a technical team will identify machines that are smart, semi-smart and dumb. Smart machines can be connected to the Cloud directly. Semi-smart machines can provide a few data points directly to cloud and require external sensors/actuators in order to send any further data points. Dumb devices cannot provide any data and require external sensors/actuators to connect and send particular data to the cloud.

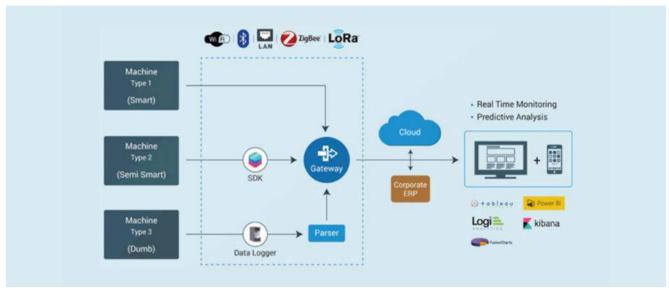

Figure: Smart Factory Solution

Edge analytics pushes the communication capabilities, processing power and intelligence of the edge gateways directly into devices such as programmable automation controllers (PACs). It involves demand forecasting and capacity planning, Predictive maintenance with advanced algorithms, Real-time demand visibility, suggesting supply chain bottlenecks, Detect anomalies at the edge and symptoms for equipment failures.

XT Series Motor Starter

Temperature/Process Limit Controllers

CE OMEGA

Industrial Ethernet Serial Servers

The XT line of IEC power control offers starting and protection solutions ideal for control panels.

The OMEGA® iSeries Limit Controller offers unparalleled flexibility in process measurement and alarm applications, accepting 10 different thermocouple types, 18 RTD combinations or 4 process voltage/current inputs

BB-ESRx Serial Servers are built for industrial environments, featuring an IP30, slim line, DIN rail mountable case. They operate from a range of voltages using AC or DC power, feature terminal block power connectors

Driving Industrial IoT Innovation

Wireless I/0

Advantech offers a broad range of wireless I/O solutions from remote data acquisition to real-time control. Our solutions are widely used in IoT or other industrial applications, such as facility monitoring, environment monitoring, and industrial process control. Advantech's new generation of remote I/O devices bring an IT oriented spirit to the market.

Industrial PCs

These modular computer systems take aim at machine automation applications such as vision inspection, AOI, packaging inspection, process automation and intelligent monitoring. Their rugged, compact designs complete with POE and the latest Intel Core processors, can also be applied in edge intelligent applications, such as edge computing, or to simply deliver enhanced computing and graphic performance.

ADVANTECH

Enabling an Intelligent Planet

Advantech's Industrial All-in-One Touch Panel Computers excel in harsh, demanding environments. Their systems include fanless designs and high G shock vibration resistance for industrial grade HMI computing requirements. With available screen sizes between 3.5" and 31.5" in both 4:3 and 16:9 configurations, most manufacturing needs are easily matched.

Industrial Connectivity

Advantech is a global leader in industrial communication, industrial Ethernet managed/unmanaged switches, industrial Fieldbus gateways, cellular routers, media converters, serial device servers, and data acquisition (DAQ).

Metallized Polyproplene **Film Capacitors**

The WDBR range of thick film planar power resistors on steel, offers high pulse withstand capability and a compact footprint with low profile, to many demanding applications.

OAR & OAR-XP resistors give designers stable and accurate sensing of AC and DC currents in a compact SMD format, whilst elevating the hotspot off the PCB.

Type 953B AC rated, radial leaded box, UL 810 fail safe, rated 10,000

Eaton[®] can help your building go green

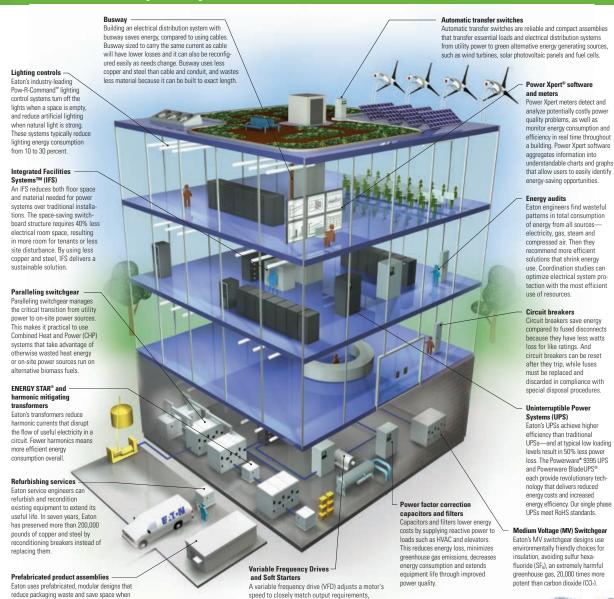

Going green—using natural resources wisely while reducing the impact of human activity on the environment—means more than just being environmentally responsible. It's good business, too.

Buildings play a key role in our impact on the environment. According to the U.S. Green Building Council (USGBC®), building operations account for 65 percent of the electrical

energy used in the United States, which can really affect your bottom line.

Take a look at some ways Eaton's PowerChain Management® portfolio of Cutler-Hammer® and Powerware® products, services and information management tools can help your building go green. Any of these solutions may help buildings qualify for LEED® credits through the USGBC.

The Eaton difference: Inside the green building

Eaton: A bigger impact on the marketplace, a smaller footprint on the world

Eaton believes that companies everywhere must answer the same question over the next decade. How can we sustain our growth, both profitably and responsibly? And we believe tomorrow's leaders will be the companies tha master sustainable growth.

they're installed. Integrated power assemblies, for

preassembled and tested before they're shipped

example, are complete installations that are

Eaton's commitment to sustainability is longstanding. We are a member of the U.S. Green Building Council, the Green Grid and the Greer Suppliers Network, and we participate in the international Carbon Disclosure Project (CDP). As a member of the Business Roundtable's Climate RESOLVE initiative, we have pledged to reduce our greenhouse gas emissions intensity by 18 percent (adjusted for sales) by 2012. And, we published our first public sustainability report sharing our progress toward our sustainability goals in 2006.

Our operations put our beliefs about sustainability into practice. In 2007, we will begin measuring the performance of all of our facilities against our Global Management System of Environment, Safety, Security and Health (MESH), a unified system for managing our environmental, safety and health initiatives across the globe. We pursue a wide range of initiatives to improve our efficiency, conserve resources and protect the health and safety of our employees. And we're achieving results. Our new plant in Shandong province, China, has been praised as a model of environmentally conscious development. An energy conservation program at our truck transmission plant in San Luis Potosi, Mexico, reduced energy consumption by 40 percent. Over the past two years, our valve manufacturing plant in Searcy, Arkansas, has shrunk its generated waste by 70 percent. And we strive to help our customers go green. Our automobile engine superchargers help

• • • the green grid member

resulting in typical energy savings of 10 to 50 percent. Soft starters lower the demands on a

motor during start-up, conserving energy and

extending the life of the mechanical system.

automakers use smaller, cleaner engines that deliver the horsepower consumers crave, plus the fuel efficiency they desire. Our Hybric Power Systems boost fuel economy and reduce emissions in trucks and buses.

Eaton can help you operate a building in ways that are both smart and sustainable. To learn more, visit www.eaton.com/greenbuildings.
